

10.1 Use Properties of Tangents

Before

You found the circumference and area of circles.

Now

You will use properties of a tangent to a circle.

Why?

So you can find the range of a GPS satellite, as in Ex. 37.

Key Vocabulary

- **circle**
center, radius, diameter
- **chord**
- **secant**
- **tangent**

A **circle** is the set of all points in a plane that are equidistant from a given point called the **center** of the circle. A circle with center P is called “circle P ” and can be written $\odot P$. A segment whose endpoints are the center and any point on the circle is a **radius**.

A **chord** is a segment whose endpoints are on a circle. A **diameter** is a chord that contains the center of the circle.

A **secant** is a line that intersects a circle in two points. A **tangent** is a line in the plane of a circle that intersects the circle in exactly one point, the *point of tangency*. The *tangent ray* \overrightarrow{AB} and the *tangent segment* \overline{AB} are also called tangents.

EXAMPLE 1 Identify special segments and lines

Tell whether the line, ray, or segment is best described as a *radius*, *chord*, *diameter*, *secant*, or *tangent* of $\odot C$.

- | | |
|--------------------------|--------------------------|
| a. \overline{AC} | b. \overline{AB} |
| c. \overrightarrow{DE} | d. \overrightarrow{AE} |

Solution

- \overline{AC} is a radius because C is the center and A is a point on the circle.
- \overline{AB} is a diameter because it is a chord that contains the center C .
- \overrightarrow{DE} is a tangent ray because it is contained in a line that intersects the circle at only one point.
- \overrightarrow{AE} is a secant because it is a line that intersects the circle in two points.

GUIDED PRACTICE for Example 1

- In Example 1, what word best describes \overline{AG} ? \overline{CB} ?
- In Example 1, name a tangent and a tangent segment.

READ VOCABULARY

The plural of radius is *radii*. All radii of a circle are congruent.

RADIUS AND DIAMETER

The words *radius* and *diameter* are used for lengths as well as segments. For a given circle, think of *a radius* and *a diameter* as segments and *the radius* and *the diameter* as lengths.

EXAMPLE 2 Find lengths in circles in a coordinate plane

Use the diagram to find the given lengths.

- Radius of $\odot A$
- Diameter of $\odot A$
- Radius of $\odot B$
- Diameter of $\odot B$

**Solution**

- The radius of $\odot A$ is 3 units.
- The diameter of $\odot A$ is 6 units.
- The radius of $\odot B$ is 2 units.
- The diameter of $\odot B$ is 4 units.

**GUIDED PRACTICE for Example 2**

- Use the diagram in Example 2 to find the radius and diameter of $\odot C$ and $\odot D$.

COPLANAR CIRCLES Two circles can intersect in two points, one point, or no points. Coplanar circles that intersect in one point are called *tangent circles*. Coplanar circles that have a common center are called *concentric*.

2 points of intersection

1 point of intersection
(tangent circles)

no points of intersection

READ VOCABULARY

A line that intersects a circle in exactly one point is said to be *tangent* to the circle.

COMMON TANGENTS A line, ray, or segment that is tangent to two coplanar circles is called a *common tangent*.

EXAMPLE 3 Draw common tangents

Tell how many common tangents the circles have and draw them.

Solution

- a. 4 common tangents b. 3 common tangents c. 2 common tangents

**GUIDED PRACTICE** for Example 3

Tell how many common tangents the circles have and draw them.

**THEOREM***For Your Notebook***THEOREM 10.1**

In a plane, a line is tangent to a circle if and only if the line is perpendicular to a radius of the circle at its endpoint on the circle.

Proof: Exs. 39–40, p. 658

Line m is tangent to $\odot Q$
if and only if $m \perp QP$.

EXAMPLE 4 Verify a tangent to a circle

In the diagram, \overline{PT} is a radius of $\odot P$.
Is \overline{ST} tangent to $\odot P$?

Solution

Use the Converse of the Pythagorean Theorem. Because $12^2 + 35^2 = 37^2$, $\triangle PST$ is a right triangle and $\overline{ST} \perp \overline{PT}$. So, \overline{ST} is perpendicular to a radius of $\odot P$ at its endpoint on $\odot P$. By Theorem 10.1, \overline{ST} is tangent to $\odot P$.

EXAMPLE 5 Find the radius of a circle

In the diagram, B is a point of tangency. Find the radius r of $\odot C$.

Solution

You know from Theorem 10.1 that $\overline{AB} \perp \overline{BC}$, so $\triangle ABC$ is a right triangle. You can use the Pythagorean Theorem.

$$AC^2 = BC^2 + AB^2 \quad \text{Pythagorean Theorem}$$

$$(r + 50)^2 = r^2 + 80^2 \quad \text{Substitute.}$$

$$r^2 + 100r + 2500 = r^2 + 6400 \quad \text{Multiply.}$$

$$100r = 3900 \quad \text{Subtract from each side.}$$

$$r = 39 \text{ ft} \quad \text{Divide each side by 100.}$$

THEOREM

For Your Notebook

THEOREM 10.2

Tangent segments from a common external point are congruent.

Proof: Ex. 41, p. 658

If \overline{SR} and \overline{ST} are tangent segments, then $\overline{SR} \cong \overline{ST}$.

EXAMPLE 6 Find the radius of a circle

\overline{RS} is tangent to $\odot C$ at S and \overline{RT} is tangent to $\odot C$ at T . Find the value of x .

Solution

$$RS = RT \quad \text{Tangent segments from the same point are } \cong.$$

$$28 = 3x + 4 \quad \text{Substitute.}$$

$$8 = x \quad \text{Solve for } x.$$

GUIDED PRACTICE for Examples 4, 5, and 6

7. Is \overline{DE} tangent to $\odot C$?

8. \overline{ST} is tangent to $\odot Q$. Find the value of r .

9. Find the value(s) of x .

10.1 EXERCISES

HOMWORK KEY

○ = **WORKED-OUT SOLUTIONS**
on p. WS1 for Exs. 7, 19, and 37

★ = **STANDARDIZED TEST PRACTICE**
Exs. 2, 29, 33, and 38

SKILL PRACTICE

EXAMPLE 1

on p. 651
for Exs. 3–11

- VOCABULARY** Copy and complete: The points A and B are on $\odot C$. If C is a point on \overline{AB} , then \overline{AB} is a ?.
- ★ **WRITING** Explain how you can determine from the context whether the words *radius* and *diameter* are referring to a segment or a length.

MATCHING TERMS Match the notation with the term that best describes it.

- | | |
|------------------------------|----------------------|
| 3. B | A. Center |
| 4. \overleftrightarrow{BH} | B. Radius |
| 5. \overline{AB} | C. Chord |
| 6. \overleftrightarrow{AB} | D. Diameter |
| 7. \overleftrightarrow{AE} | E. Secant |
| 8. G | F. Tangent |
| 9. \overline{CD} | G. Point of tangency |
| 10. \overline{BD} | H. Common tangent |

Animated Geometry at classzone.com

- ERROR ANALYSIS** Describe and correct the error in the statement about the diagram.

EXAMPLES 2 and 3

on pp. 652–653
for Exs. 12–17

COORDINATE GEOMETRY Use the diagram at the right.

- What are the radius and diameter of $\odot C$?
- What are the radius and diameter of $\odot D$?
- Copy the circles. Then draw all the common tangents of the two circles.

DRAWING TANGENTS Copy the diagram. Tell how many common tangents the circles have and draw them.

15.

16.

17.

EXAMPLE 4

on p. 653
for Exs. 18–20

EXAMPLES 5 and 6

on p. 654
for Exs. 21–26

DETERMINING TANGENCY Determine whether \overline{AB} is tangent to $\odot C$. Explain.

18.

19.

20.

xy ALGEBRA Find the value(s) of the variable. In Exercises 24–26, B and D are points of tangency.

21.

22.

23.

24.

25.

26.

COMMON TANGENTS A *common internal tangent* intersects the segment that joins the centers of two circles. A *common external tangent* does not intersect the segment that joins the centers of the two circles. Determine whether the common tangents shown are *internal* or *external*.

27.

28.

29. **★ MULTIPLE CHOICE** In the diagram, $\odot P$ and $\odot Q$ are tangent circles. \overline{RS} is a common tangent. Find RS .

- (A) $-2\sqrt{15}$
(B) 4
(C) $2\sqrt{15}$
(D) 8

30. **REASONING** In the diagram, \overrightarrow{PB} is tangent to $\odot Q$ and $\odot R$. Explain why $\overline{PA} \cong \overline{PB} \cong \overline{PC}$ even though the radius of $\odot Q$ is not equal to the radius of $\odot R$.

31. **TANGENT LINES** When will two lines tangent to the same circle not intersect? Use Theorem 10.1 to *explain* your answer.

32. **ANGLE BISECTOR** In the diagram at right, A and D are points of tangency on $\odot C$. Explain how you know that \overline{BC} bisects $\angle ABD$. (Hint: Use Theorem 5.6, page 310.)

33. **★ SHORT RESPONSE** For any point outside of a circle, is there ever only one tangent to the circle that passes through the point? Are there ever more than two such tangents? Explain your reasoning.

34. **CHALLENGE** In the diagram at the right, $AB = AC = 12$, $BC = 8$, and all three segments are tangent to $\odot P$. What is the radius of $\odot P$?

PROBLEM SOLVING

BICYCLES On modern bicycles, rear wheels usually have *tangential spokes*. Occasionally, front wheels have *radial spokes*. Use the definitions of *tangent* and *radius* to determine if the wheel shown has *tangential spokes* or *radial spokes*.

EXAMPLE 4

on p. 653
for Ex. 37

37. **GLOBAL POSITIONING SYSTEM (GPS)** GPS satellites orbit about 11,000 miles above Earth. The mean radius of Earth is about 3959 miles. Because GPS signals cannot travel through Earth, a satellite can transmit signals only as far as points A and C from point B , as shown. Find BA and BC to the nearest mile.

@HomeTutor for problem solving help at classzone.com

38. **★ SHORT RESPONSE** In the diagram, \overline{RS} is a common internal tangent (see Exercises 27–28) to $\odot A$ and $\odot B$. Use similar triangles to explain why $\frac{AC}{BC} = \frac{RC}{SC}$.

39. **PROVING THEOREM 10.1** Use parts (a)–(c) to prove indirectly that if a line is tangent to a circle, then it is perpendicular to a radius.

GIVEN ▶ Line m is tangent to $\odot Q$ at P .

PROVE ▶ $m \perp \overline{QP}$

- Assume m is not perpendicular to \overline{QP} . Then the perpendicular segment from Q to m intersects m at some other point R . Because m is a tangent, R cannot be inside $\odot Q$. Compare the length QR to QP .
- Because \overline{QR} is the perpendicular segment from Q to m , \overline{QR} is the shortest segment from Q to m . Now compare QR to QP .
- Use your results from parts (a) and (b) to complete the indirect proof.

40. **PROVING THEOREM 10.1** Write an indirect proof that if a line is perpendicular to a radius at its endpoint, the line is a tangent.

GIVEN ▶ $m \perp \overline{QP}$

PROVE ▶ Line m is tangent to $\odot Q$.

41. **PROVING THEOREM 10.2** Write a proof that tangent segments from a common external point are congruent.

GIVEN ▶ \overline{SR} and \overline{ST} are tangent to $\odot P$.

PROVE ▶ $\overline{SR} \cong \overline{ST}$

Plan for Proof Use the Hypotenuse–Leg Congruence Theorem to show that $\triangle SRP \cong \triangle STP$.

42. **CHALLENGE** Point C is located at the origin. Line ℓ is tangent to $\odot C$ at $(-4, 3)$. Use the diagram at the right to complete the problem.

- Find the slope of line ℓ .
- Write the equation for ℓ .
- Find the radius of $\odot C$.
- Find the distance from ℓ to $\odot C$ along the y -axis.
